

Online Map Information Providing GIS Maps via Internet

OVERVIEW

Benefits

- Efficient issuing of map information via Internet
- Simple web interface with large graphics window and focused functionality
- Comfortable utility-specific multiple printing at predefined scales
- Access for registered users only
- Automatic feedback and logging of detailed information on construction measures
- Reproducibility thanks to automatic plot archiving
- Consideration of current industry guidelines

System requirements

Smallworld GIS, Version 3.21 or higher

To avoid the risk of damaging pipes and cables buried underground and putting lives in danger, builders, contractors, excavation companies, underground network maintenance workers, plumbers, cable and pipe location companies – anyone who is intending to begin digging work should lodge an enquiry to the underground asset owner before commencing. These enquiries can be carried out online using the Online Map Information application based on GE's Smallworld Internet Application Server.

Since this is predominantly a free-of-charge service to the user, the asset owners save time and money by providing plans as a self-

service. After registration, the required map sections can be selected and separated according to various layers and printed out in PDF format using an easy to use web interface with various rotatable print templates and scales are available.

To secure safety, the administration part of the application keeps a record of all online enquiries including details on the building site, the contractor and a copy of the provided PDF files. This information is automatically stored together with the associated PDF file. In this way, the application fulfils official regulations of industry associations.
